

# Git cheat sheet

Efim Abrikosov

February 2, 2019

## 1 Main commands

- `git help functionname` — display help information about Git
- `git init [--template=templatedirectory]` — create an empty Git repository or reinitialize an existing one. Files and directories in the template directory whose name do not start with a dot will be copied to the directory after it is created.
- `git clone repository [directory]` — clone a repository into a new directory. Optionally supply the name of a new directory to clone into.
- `git add [filename]` — add file contents to the index
- `git commit [-a][-m text]` — record changes to the repository
- `git diff [cached]`
- `git status`
